Capable
Measure multiple components – moisture, protein, starch, and fat content – simultaneously in seconds. Tests whole beans, lentils, peas, flours, hulls, protein concentrates, and other sample forms with little or no sample prep. It’s used at material intake, for process control, and to monitor final products.

Accurate
Our instruments have similar accuracies to reference methods of analysis. They are designed to optimize reproducibility and transferability of calibrations. Additionally, the simple sample handling, operation, and data storage increase operational accuracy significantly.

Reliable
The DA 7250 has no moving optical components and is housed in an IP65 case making it dust proof and water resistant. These ensure maximum instrument up time and low cost of ownership. The IM 9500 is a whole grain instrument designed for ease-of-use and rugged environments. Both come with a one-year warranty and a spare replaceable lamp.
